Business Requirements Document

Objectives:

1. **Turn scattered, messy client IT data into one deal-ready baseline within days**
   Apps, servers, networks, licences, people and contract files arrive from different teams in different formats. DealSync merges them into one standard dataset, fixes gaps, duplicates and stale records, and scores each file, so no decision is taken on data scoring below 90.
2. **Make sure nothing stops the business on Day-1**
   Every hidden dependency on the seller is found, every item is ranked by urgency, and critical tools and revenue systems are always flagged. All of this rolls into one live Day-1 Readiness Score with a Go or No-go, so leaders know days ahead, not on the day, whether design, orders and reporting will keep running.
3. **Stop cost disputes and tough trade-offs from delaying the deal**
   Boards get scored options with a security check built in, costs like Rioja's $1.74M are split line by line using one clear rule backed by the SPA, and any amount still disputed is funded by a bank through escrow, a bridge loan or a lease. The deal moves forward while the argument is settled separately.
4. **Cut the buyer's dependence on the seller as fast and cheaply as possible after Day-1**
   Every TSA service is tracked against its exit date and monthly cost, the most valuable blocked products are unlocked first, and systems move in a fixed order of waves only when their data is ready. This avoids costly TSA extensions and lost revenue.
5. **Give every consultant the judgement of the firm's best deal teams**
   One shared tracker and dashboard replace separate sheets and status decks, and an AI copilot reads the live deal numbers and PwC's own methods to explain what is going wrong and what to do next. Consultants spend less time on reporting and more on decisions, while a person still makes every call.
6. **Make every deal improve the next one without exposing any client**
   At close, each deal becomes an anonymised, human-approved lesson, kept only with client consent and under strict access and deletion rules. These lessons speed up future deals, and the anonymised patterns become benchmarks and scorecards that help PwC win new clients.

Key Stakeholders:

1. **Buyer's leadership**
   The client leaders, including the CIO, CFO and CISO, who own the deal and make the

Day-1 Go or No-go call. They rely on DealSync's Readiness Score, blockers and scoring options to approve decisions, and they see only their own deal.

2. **Seller's IT team**
   They hold most of the original data and keep TSA services running after Day-1. Their data, answers on hidden links and help with exit dates decide how quickly the buyer becomes independent.
3. **PwC engagement team (Consultants)**
   The partner, manager and consultants who run DealSync on the deal. They clean the data, review AI suggestions, use the copilot and own every recommendation given to the client.
4. **PwC (Company)**
   With these frameworks scaled across the firm, while Risk, Legal and Privacy make sure client data is used only with consent and under strict rules. Together, they decide where DealSync is rolled out and how lessons can be safely reused.
5. **Banks**
   They fund cost gaps like Rioja's $1.74M through escrow, bridge loans or leases, using the readiness score and cost split shared with client consent.

Scope

- **Deals covered:** Carve-outs, acquisitions, divestitures and mergers run by PwC's Corporate Deals Technology practice.
- **Deal stages:** From pre-deal data collection through Day-1 and the TSA period to final TSA exit.
- **What it covers:** All IT parts of a deal: apps, servers, networks, licences, user access, moving employees, costs and TSA services.
- **Users:** PwC deal teams (full access), client leaders (read-only view of their own deal) and banks (only what the client approves).
- **Internal use:** Reusing anonymised lessons across PwC and using benchmarks for marketing.
- **Prototype:** Built in Google AI Studio with Gemini, using sample data.

Expected Outcomes

1. **Decisions are made on data everyone trusts**
   Teams stop arguing over whose spreadsheet is right. Every file is merged, cleaned and scored, so the board, PwC and the seller all work from the same version of the facts.
2. **Day-1 happens without surprises**
   Critical tools, revenue systems and hidden links to the seller are found weeks in advance. The board sees exactly what is blocking Day-1 and who owns it, and the business keeps designing, selling and reporting from the first day.

3. **Money and trade-offs no longer hold the deal back**
   Cost disputes are settled line by line with clear reasons, leaders choose between options in one meeting instead of several, and any amount still in dispute is funded by a bank so work continues.
4. **The buyer stands on its own sooner and at lower cost**
   TSA services are exited on schedule, extra months of seller fees are avoided, and the most valuable blocked products start earning again first.
5. **Consultants spend their time solving problems, not building reports**
   One tracker and one dashboard replace scattered sheets and status decks, and the copilot gives quick, sourced answers. Even a junior consultant can work with the method and judgement of an experienced team.
6. **Every deal makes PwC better at the next one**
   Lessons from each deal are saved safely and matched to new deals, so teams start with proven methods instead of a blank page, and client confidentiality is never put at risk.

Success Criteria

1. **Data is clean before it's used**
   Every data file reaches a hygiene score of 90 or above before it feeds any decision, and every gap left over has a named owner and a deadline.
2. **No business stops on Day-1**
   Zero Day-1 failures of critical tools or revenue systems on pilot deals, and no failure caused by a hidden link that wasn't on the map.
3. **Readiness is known early**
   The Day-1 Readiness Score is updated every day, and the board has a clear Go or No-go at least two weeks before Day-1.
4. **Decisions and disputes are settled faster**
   Board decisions are closed 25% faster than before, every cost line is split with a written reason, and 100% of the funding needed, including disputed amounts, is in place before Day-1.
5. **The buyer exits the TSA on time**
   No TSA service is extended because of late tracking, and the products with the highest blocked revenue are unlocked first.
6. **Less time is spent on reporting**
   Time spent building status reports drops by 30%, and all tasks sit in one shared tracker instead of separate sheets.
7. **Consultants trust and use the copilot**
   At least 85% of copilot answers are rated correct on a test set of 200 deal questions, every answer names its source, and at least 70% of pilot consultants use it every week.
8. **Knowledge is reused safely**
   A Learning Record is saved for 100% of closed deals where the client gave consent, at least 80% of new deals start with matched past lessons, and there are zero data leaks or access breaches.

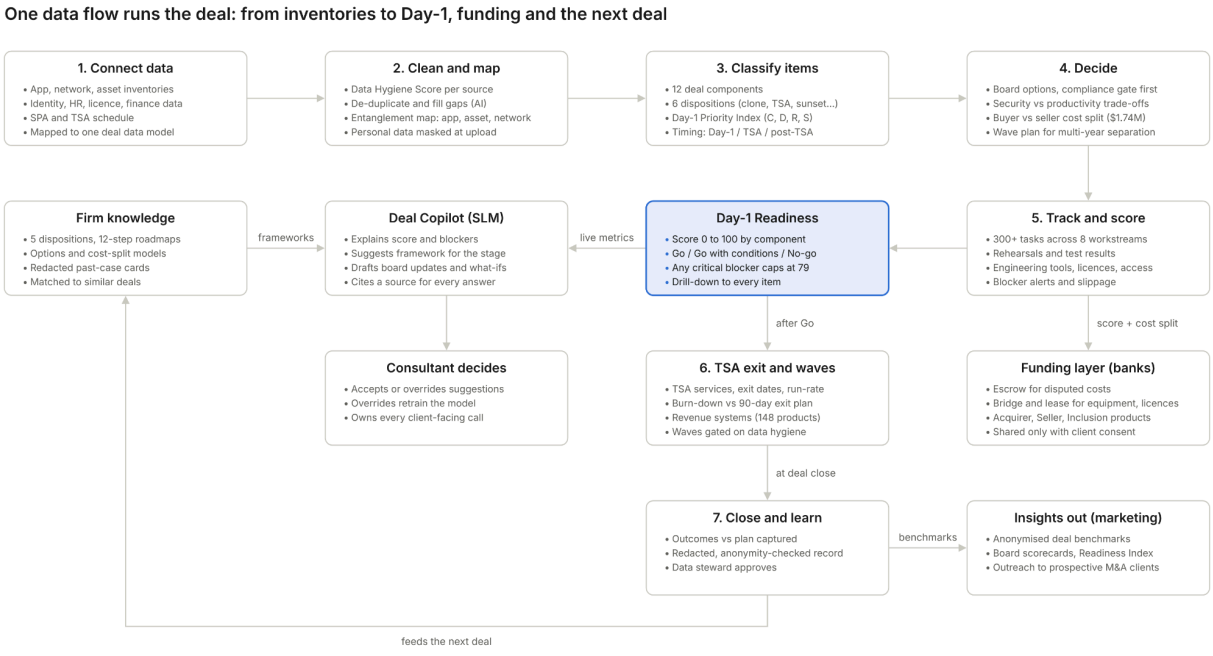

Functional Requirements (Specific Features & Actions)

- **Data intake and cleaning**
    - Upload all deal files, match column names with AI, flag broken links and hide personal data.
    - Fill gaps (rules first, then AI), merge duplicates, flag stale records and score each file, blocking anything below 90.
    - Send unresolved items to an owner queue with a deadline.
- **Dependency map**
    - Map all links, suggest hidden ones with AI, and confirm them through an owner questionnaire.
    - Tag links as buyer, shared or seller, calculate an Entanglement Score and form move groups.
- **Classification**
    - Tag items to 12 components, calculate the Priority Index and timing, and always treat critical tools and revenue items as Day-1 critical.
    - Suggest one of 6 buckets per app with a reason, which the user can change.
- **Decisions and cost split**
    - Score options after a security check, with an AI-written board summary.
    - Split costs using the 3-question rule, read SPA clauses with AI, and send disputed amounts to funding.
- **Tracking and Day-1 readiness**
    - Keep all tasks in one tracker, show workstream progress, and flag at-risk tasks with an AI-written next step.
    - Calculate one Day-1 Readiness Score (Go / Conditions / No-go), cap it at 79 if a critical item is blocked, and allow drill-down.
- **TSA exit and waves**
    - Track TSA services against exit dates and fees, flag extension risks, rank blocked products by revenue, and release waves only when data is green.
- **Funding**
    - Show escrow, bridge loan and lease options using Prowess financial health, shared with banks only after client consent.
- **Close and learn**
    - Capture closing lessons, create an anonymised Learning Record with AI, and save it only after human approval and client consent.
- **Deal Copilot**
    - Answer questions using live dashboard numbers, PwC frameworks and past deals, cite a source or say “I don’t know”, never change data, and log overrides.
- **Insights and marketing**
    - Show anonymised benchmarks, create board scorecards, and rank likely future clients using Prowess.

Non-Functional Requirements (How well system must work)

- **Security**: Secure login with role-based access, so each user sees only their own deal and only what their role needs.
- **Privacy and compliance**: Personal data is hidden at upload, raw client data is deleted after the deal, and data protection laws (DPDP Act, GDPR) and contract terms are followed.
- **Approved AI only**: Deal data goes only to approved AI services that do not keep it or train on it.
- **Accuracy**: At least 85% of copilot answers are correct, every answer names its source, and it says “I don’t know” when unsure.
- **Explainability**: Every score can be traced back to its formula and the items behind it.
- **Human control**: AI only suggests; a person approves every decision, and all changes and overrides are logged.
- **Speed**: Pages load in under 3 seconds and the copilot replies in under 5 seconds.
- **Reliability**: The platform is available 99.5% of the time, and more during the weeks around Day-1.
- **Ease of use**: A new consultant can use it after a 2-hour walkthrough, on a laptop or tablet.
- **Scalability**: It handles many deals at once, from small deals to large ones like Phoenix (400+ apps, 35,000+ records).
- **Easy to update**: Scoring weights, thresholds and frameworks can be changed without rebuilding the app.

Solution: AI Workflow

1) Current Problems: External

a) **Data is Scattered & Messy:**
    i) App, network and asset details sit in many different systems that don't talk to each other.
    ii) Plus data records are missing, duplicated or out of date, like Phoenix's 35,000+ incomplete network records.
b) **Hidden Links across systems:**
    i) Nobody fully knows which apps depend on which servers or seller systems, so things break on Day-1.
c) **No clear Day 1 status:**
    i) Leaders can't see at a glance whether the deal is ready for Day-1 or what is blocking it.
    ii) One missing tool can stop the business from operating normally
    iii) Stuck systems can cause revenue to get blocked
d) **Arguments over costs:**
    i) Buyer and seller argue over costs, like Rioja's $1.74M equipment and licence gap.
e) **Too much to track:**
    i) Hundreds of apps, tasks & assets are tracked in separate sheets

2) **<u>Current Problems: Internal</u>**
    a) Work is redone on every deal
    b) Client data cannot be freely reused
    c) Scale the PwC solutions firmwide
        i) Giving options to leaders with tradeoffs such as security vs staff productivity
        ii) Product priority list & Step by Step plans for what to do & in what order
        iii) Five buckets for every app
        iv) Clean network data & fix PwC's record gaps
        v) Clearing split of who pays
        vi) Automated dashboards
        vii) AI deal knowledge hub
